Day - 08

Lecture - 06

Media Tag / Multi-Page Website

Media Tag - Media tag are used to add audio, video, or media queries to a webpage.

audio tag - Used to embed sound in a webpage.

```
<audio src = ".song.mp3" > </audio>
```

The audio will not be visible on the webpage.

```
<audio src = ".song.mp3" controls > </audio>
```

Controls will give you access to control the audio and shows play/pause buttons.

- But this is not a good way to add audio tag

<audio controls>

<source src = ".\audio.ogg" type = "audio/ogg">

<source src = ".\wavy.mp3" type = "audio/mp3">

</audio> Your browser does not support the audio tag

- This is a good way

- Here if browser doesn't support one format then it can switch to another one automatically

video tag - Used to play videos. Same as audio, it uses controls

<video src = ".\video.mp4" controls> </video>

Without control video will be display as static image. You can't play it, pause or change volume.

<video controls height = "300px">

<source src = ".\video.mp4" type = "video/mp4">

</video>

How to add Youtube video links to webpage?

- <iframe> used to embed another webpage, video, map etc. to your website.

There are two ways to add video.

1st method: When you copy the link from tab.

https://www.youtube.com/ watch?v=JpmP4Gv8r3Q
Youtube.com 11 character video Id

↓
Remove this
portion and write
embed with slash

`<iframe src = "https://www.youtube.com/embed/JpmP4Gv8r3Q"`

This will show the video on webpage or
you can add height width if needed

2nd method: When you ~~share~~ click on share button
and then copy the link

https://youtu.be/ NGYp1zCBthk ?si=ytEy2JcoJRH3SweZ
↓ video Id Share Id

Instead of this

write youtube.com/embed to embed the video

`<iframe src = "https://youtu.be/embed/NGYp1zCBthk?si=ytEy2JcoJRH3SweZ"`

Attributes: You can use some attributes in video
or iframe tag to give some extra
functionality.

`<video src = ".\video.mp4" autoplay muted controls > </video>`

Autoplay the video but with
no sound

`<video src = ".\video.mp4" poster = "images/video-thumbnail.jpg" controls > </video>`

It specifies an image to display before the video is played, just like a Youtube thumbnail

`<iframe src = " " allowFullscreen > </iframe>`

↓
youtube
link

Allowed the video to play on
full screen

- How to make multipage website?

- Use ~~un~~ unordered list and anchor `<a>` `<a>` tag

`<ul>`

`<li> <a href = "index.html"> HomePage </a> </li>`

`<li> <a href = "Contact.html"> Contact us </a> </li>`

`</ul>`

- Deploying website on Netlify

- Make one folder and ensure index.html is the main entry.

Option-1

• Drag and drop
your folder

Option-2

Deploy from
github
